$\frac{dI}{dt} = \frac{V}{L}$

Wheatstone bridge

Wheatstone bridge is used to measure the resistance of a thermistor. The circuit consists of a battery E , a micro-ammeter calibrated in terms of temperature, and a thermistor. The current i flows through the circuit.

The resistance of the thermistor varies with temperature. The micro-ammeter is used to measure the current i flowing through the thermistor. The current i is related to the resistance R of the thermistor by the equation $i = \frac{E}{R}$. The resistance R is related to the temperature T by the equation $R = R_0 [1 + \alpha(T - T_0)]$. The micro-ammeter is calibrated in terms of temperature, so the current i is a function of temperature T .
